I've seen that the Event Object provides the methods withEvent (which is self-important enough) and is.notifyAll and is.notify (which is not self-important enough). So why not use the Event Object as a subclass? The standard gives no explanation, it seems like an odd use for an object that "represents a notification of a message event to the objects listening to it". A: Why not use the Event Object as a subclass? The only reason I can think of is that some code from Java 1.1 was still there. I think this is probably a bogus reason. The standard gives no explanation, it seems like an odd use for an object that "represents a notification of a message event to the objects listening to it". I agree. It doesn't make a lot of sense. Why should you be allowed to call a constructor of a superclass from a constructor of a subclass? Allowing it would allow inheritance to behave like composition. It seems very "Java" to me. a1d647c40b
