a collection of software that includes Photoshop. The most recent version is now Photoshop CC (Creative Cloud), which allows you to access your artwork online. How to Use Photoshop Key Commands The most important feature of Photoshop is the Layer tab, where you can work on the layers of your image. You can apply brushstrokes, erase areas, add colors, and more. You can also make a selection, move things around, alter the way layers interact, and then save the file as a PSD (Photoshop Document). You may also be familiar with the Edit tab, where you can make changes to the image, like color adjustment, cutting and pasting, or resizing. The Favorites tab is the way to save common tasks or shortcuts. The PS menu, or the Tools tab, includes tools to save, copy, and create vectors. If you are not sure where to begin your journey, the Key Commands list on the right side of the Photoshop window can teach you how to use Photoshop. The Quick menu will allow you to access most of the features of the software without the need for a keyboard. The Help menu will direct you to the Adobe web site to learn more about any feature of the software.

Photoshop keyboard shortcuts differ from the industry standard image editing program, the Gimp, because it does not use a layer based interface. Summary: Aromatic-Aromatic Steroid Hybrid Compounds with Inhibitory Effects on Protein Kinase D. Aromatic-Aromatic Steroid Hybrid Compounds (AACs) are a new chemical class which has been shown to possess a wide spectrum of biological activities. Protein kinase D (PKD) is a serine/threonine kinase, implicated in multiple signaling pathways that promote growth, survival, migration, and invasion of tumors. An examination of the AACs activity against PKD was conducted. Our research indicates that 4 AACs, including 2-(5-chloro-2-pyridyl)-1-cyclopentyl-1,2,4,6-tetrahydropyridine, 1,5,6,7-tetrahydroxy-2,3-dihydro-4-phenyl-3-quinolyl-2-one, 5-bromo-2-(3,4-dihydroxyphenyl)-3,4-dihydro-1-tetrahydropyridin-1-one, and 2-(3,4-dihydroxyphenyl)-1-cyclopentyl-1,2,4,6-tetrahydropyridine, are potent inhibitors of PKD and showed anti-proliferative activities. Moreover, these compounds were found to synergistically promote apoptosis of DU-145 cells. 3D-QSAR studies revealed that 2 AACs shared a similar binding mode with ATP, the pseudo-active site (APS), and the allosteric binding site (AS) of PKD. Bisphenol AF (BP-AF), a known PKD inhibitor, was used to assess the AACs activity on ATP binding site. Comparative docking simulation revealed that AACs may bind to the ATP-binding site of PKD in a similar pattern to that of BP-AF. This study provides the first evidence on AACs as inhibitors of PKD and their potential application in cancer therapy. Historically, most newspaper content has been created manually. In general, this requires a writer who creates the content, one who selects which words and phrases will appear in the text, another who selects the layout of the content, and still another to prepare a finished printing product for publishing. A typical newspaper or magazine page is shown in FIG. 1. The page contains six columns, two

Evaluation of fluorouracil-cisplatin/nedaplatin combined with 5-fluorouracil or oral tegafur/uracil (UFT) in patients with metastatic or advanced gastric cancer. We investigated the combination of fluorouracil, cisplatin and nedaplatin (FP/CDDP) in metastatic or advanced gastric cancer compared with continuous oral administration of tegafur and uracil (UFT) in patients with metastatic or advanced gastric cancer. A total of fifty-four patients received FP/CDDP from January 1998 to December 1999; the other 44 patients received UFT from February 1999 to December 1999. The median overall survival (OS) times were not significantly different between the FP/CDDP group and the UFT group (17.2 months versus 18.0 months, respectively). The cumulative survival rate after one course of the FP/CDDP regimen was significantly higher than that after one course of the UFT regimen (83.3% versus 60.0%, respectively, $p=0.036$). Both regimens were well-tolerated. Major toxicities were nausea and vomiting in the FP/CDDP group and diarrhea in the UFT group. This combination chemotherapy is expected to be one of the useful second-line chemotherapies for advanced gastric cancer. The present invention relates to light-emitting diodes (LEDs). More particularly, the invention relates to a light-emitting diode with a plurality of light-emitting regions arranged in parallel, wherein the light-emitting regions are connected in parallel in

order to achieve a higher output power. Light-emitting diodes are known for some time and, in certain circumstances, high-power light-emitting diodes are used for lighting purposes. In order to achieve a higher output power, it is already known for the LED or diode chip to be arranged in a stack, wherein the light-emitting regions of a plurality of LEDs or diodes are connected in series. However, this approach, in which the light-emitting regions are connected in series, has the disadvantage that, if an LED or diode is not operating correctly, the entire array of diodes can no longer be operated. Thus, if an LED or diode has a faulty connection or a faulty electrical contact, the entire array of diodes arranged in a stack is no longer
