History AutoCAD has a long history of development, which can be traced back to 1979, when John Warnock began working on a simplified version of AutoLisp called ACID. Although Warnock was no longer involved with the product, the product name changed several times before its final version was released in 1982, and Warnock's vision of a product that automated the drafting process helped set the course for what the final product would be. AutoLisp was designed as an Autocad compatible dialect of Lisp, and it was one of the first desktop CAD programs to be written entirely in Lisp. The product was marketed as Autocad++, in contrast to the then dominant industry leader AutoCAD. With this strategy, Warnock tried to carve out his own market among the then dominating mainframe CAD vendors who had little interest in desktops. Unfortunately, the mainframe CAD vendors (especially Autodesk) considered the language and the product to be a novelty, and rejected it. AutoLisp was eventually discontinued in 1985. In 1984, Warnock founded the company Solidworks, Inc., with a goal of developing a more powerful CAD product for a desktop market. The company was renamed AutoCAD, Inc. in 1986. The original Autocad product was a 1.2 version, providing basic two-dimensional drafting capabilities and limited 3D capabilities. AutoCAD 2.0 was released in 1989, with many improvements. AutoCAD 3.0 was released in 1991, and many more improvements were made in later versions. In 1994, the company changed its corporate name from Solidworks, Inc., to Autodesk, Inc. The product name changed from Autocad to AutoCAD in 1996. In 1997, a beta version of AutoCAD 9.0 was released. Although it only contained bugs and needed more work, it was a major step forward in the product's capabilities. The first official release of AutoCAD 9.0 was in 1999. Version 9.0 was not a new product release, but rather an updating of the existing product with many enhancements and fixes. Many of these improvements were aimed at alleviating the workarounds needed to work with older legacy application and operating system combinations. Awards and recognition AutoCAD was named Best in Show at the AEC Europe show in Frankfurt in 1998, and again in 1999. It was named the best CAD software in the USA and Canada at CAD/

Twitter said it blocked four thousand six hundred and fifty five million tweets for a number of hours. One of the key networks within online gaming was also affected. Microsoft downplayed the incident, "We don't comment on individual events, but we are committed to providing high quality and reliable Xbox Live service to all our Xbox Live members." A distributed denial of service attack will see several computer servers repeatedly attacked by tens of thousands of IP addresses, flooding the target with so much data that the servers are rendered useless. It is often aimed at a website, but can also be used to attack other computer networks. The attack was aimed at the PlayStation network, Xbox Live and other gaming networks. Q: How to disable auto sort by name in TQuery I am creating a basic client/server communication app using Delphi XE2 and D2010. I have a Database of customers. All the data (IDs, Names, Phone Numbers,...) is stored in a TQuery database. In order to display the customers in a listview, I've used this code: procedure ListViewCustomers.CustomClientLoad(Sender: TObject; Request: TCustomClientRequest; var AResponse: TCustomClientResponse); begin GetCustomers(); end; procedure TForm1.GetCustomers(); var DBM: TDatabaseManager; Customer: TObject; CustID: Integer; CustName, CustPhone, CustEmail: string; begin DBM := TDatabaseManager.Create(True); DBM.HostName := 'localhost'; DBM.UserName := 'username'; DBM.Password := 'pass'; CustID := 1; CustName := ''; CustPhone := ''; CustEmail := ''; OpenQuery(DBM, 'SELECT ID, NAME, PHONE, EMAIL FROM CUSTOMER'); FillCustomers(CustID, CustName, CustPhone, CustEmail); end; function TForm1.FillCustomers(CustomerID: Integer; Name: string; Phone: string; Email: string): Boolean; var query: TQuery; custID, custName, custPhone, custEmail: Integer; begin query := TQuery.Create(self); query.Connection := DBM; custID := query.FieldByName('ID').AsInteger; custName := query.FieldByName('NAME').AsString; custPhone := query.FieldByName('PHONE').AsString; custEmail := query.FieldByName('EMAIL').AsString;
