More than two years after the Department of Justice twice obtained a search warrant for the Associated Press offices, an Obama administration appeals court in San Francisco ruled Thursday that journalist records seized by the government during the raid in 2015 are now off limits to the prosecutors. By Thursday's ruling, the government is now out of luck. The court's ruling means the prosecutors in the case, which has dragged on for the better part of a decade, will have to start all over again. They would have to apply to a new federal court for a warrant if they wish to get the records. How the ruling works

Attorneys for the Associated Press applauded the decision. "We are very pleased that the court recognized the public's interest in the unprecedented seizure of the Associated Press' phone records by the Obama administration," said David McCraw, the AP's general counsel. "We look forward to appealing to the Supreme Court." McCraw also said he was disappointed to hear the ruling and the government's failure to abide by the law. "The Department of Justice and the Attorney General are quick to point out that this court ruling should not have any effect on the criminal charges against the [alleged source of the leak], including the most serious charges of identity theft and conspiracy to steal government property," he said. "It is unfortunate that the Department of Justice fought this for so long even after twice being told in explicit terms that federal law requires the return of all records it seized from the AP." The ruling has long been a critical issue for the AP's request for information on a story about leaks of classified government information. The AP has long argued that its constitutional rights were violated when the government seized all of its phone records. The department's argument was, essentially, that it could search anything and everything it wanted because the AP had authority to obtain the records of its reporters and editors. The appeal at issue was a challenge to a June 2016 warrant obtained by the government to search and seize the AP's records. A three-judge panel of the 9th Circuit ruled in favor of the AP in the decision Thursday. The judges said that even though federal law requires that all records and materials seized be returned to a news organization, the courts must take into account how much of the material still exists. And they wrote that the government can't just pick and choose what parts of the records it keeps. "Such an interpretation would render virtually meaningless the requirement that

Q: Google Custom Search App Engine and Requirements for SearchFeed I've tried to use Google Custom Search on App Engine in Python. For some reason, as soon as I call SearchFeed or any Google API in App Engine it stop running. In a Python script that will run on App Engine I need to search hundreds of thousands of webpages for keywords. I'm pretty sure that there is something wrong with my search query because when i run this script in a local environment it takes around 17 seconds. Searching for the same query in Google websearch takes about 0.3 seconds and returns about 2400 (or more) results. Can I use Google Custom Search for this kind of tasks on App Engine? What are the things that I can't do with Google Custom Search on App Engine that I can do on Google websearch? Is there any way to debug Google Custom Search on App Engine? Thanks in advance! # /usr/local/bin/python """ Module Description: API user search script """ import os import webapp2 from google.appengine.ext import db from google.appengine.ext import webapp from google.appengine.ext import search from

```
google.appengine.ext.webapp import util from google.appengine.api import users class
MainPage(webapp.RequestHandler): def get(self): search_words =
users.get_current_user().email search_query = ".*appengine.google.com/search?q=" +
search_words + "&num=1000&source=gb" request = search.Query()
request.request(search_query) search_feed = search.QueryFeed() response =
search_feed.send(self.request.path) if response.is_success: results = [] for item in
response.results: #results.append(item.url)
```
