Is there a way I can burn my books to a disc and read it on my desktop rather than the kindle?1. Field of the Invention The present invention relates generally to data communication circuits and, more particularly, to a receiver for a digital communication system. 2.

Related Art Digital communication systems use transmitters to transmit information and receivers to receive information. Generally, in digital communications, information to be transmitted by the transmitter is initially converted to a series of ones and zeros by the transmitter's modulator. The modulator is driven in response to a modulator clock signal (xe2x80x9cmodxe2x80x9d clock) having a substantially higher frequency than the information.

This modulated signal is amplified by a driver amplifier, transmitted, and received by the receiver. In a conventional direct conversion receiver, an

intermediate frequency (IF) signal is received and amplified by an amplifier. The IF signal is then mixed to demodulate the information to be transmitted. A local oscillator controls the frequency of mixing and is driven by the same modulator clock signal used to drive the modulator. This output of the mixer is filtered by a low pass filter to remove the carrier signal, amplified by an intermediate amplification device, and provided to a base band amplifier for processing. A common source of distortion in direct conversion systems is known as the phase splitter. The phase splitter is a circuit that is external to the mixer that splits the phase of the local oscillator signal from the modulated signal. In direct conversion systems, the local oscillator is driven at a slightly lower frequency than the modulated signal. The phase splitter ensures that the local oscillator has a phase shift of 90 degrees from the modulated signal. This prevents the mixer from oscillating, and reduces the power of the signal. Since the signal is multiplied to the output of the mixer, this reduces the signal at the output of the mixer. However, a phase splitter introduces a phase shift of $\frac{1}{2}$ cycle, and, thus, adds to the total phase shift at the mixer. As such, there is a need for a receiver that overcomes the problems in the related art, as discussed above. This background information is provided to reveal information believed by the applicant to be of possible relevance to the present invention. No admission is necessarily intended, nor
