V.I.P.....All Right! As many of you know, this past month we got two hours of rehearsals and not enough to practice the ending so we were constantly backtracking to do the ending correctly. We wanted to do a video to show what our ending would look like so, we shot the video on my camcorder last night with my cell phone. We will probably come up with a title for this project so keep your eyes open for it! Jakob... Do you think we're ready to release the video?! I know it looks really bad, but hey, it is our first project! =P My friends, thanks so much for all your support and remember to share this video and press it so our friends and family can enjoy it too! Such cool shots. You're right, it doesn't look too bad. But you're right, it's your first project. You've made a great start. Now, just keep on doing what you've been doing and you'll get better and better.Q: Powershell Write-Output - Variable returns "null" value I have a very simple Powershell script that I use to control a home automation system. My script contains the following: Remove-Light | Foreach-Object { Write-Output "Turning \$(\$_.name) OFF!"; Remove-Light -ParameterName name -Force } The light mentioned above is a Ceiling Fan. The command works perfectly fine if I replace the Write-Output line with: Write-Output "Turning \$(\$_.name)

Mossberg 715t Serial Number Lookup

A: Assuming the tag in the code you have shown is not a typo, what this tag represents is a serial number in the format YYYY-MM-DD. YYYY is the year, and is based on the manufacturer's system for creating unique serial numbers. In this system the serial number is a combination of the year, month, day, and a unique number that is assigned by the manufacturer and there is no way to change it. The numbers of the database are different to yours because, for example, it was started in 2011, so the first year number is "2011-01-01", etc. (I'm sure there are similar formatting rules in place for the other 12 months and year, you can find out for yourself how to do that). So, in summary, you have asked for what looks like a different serial number to the one you think you have, it is just a different way of numbering the series you have. In short, it is completely normal.

Q: Does the file descriptor still get closed after I have called close()? I'm just curious if the file descriptor remains open and available after I've called close() on it. I'm working on a project and recently made a change to the code that allows me to loop over subprocesses and call close() if subprocess.call(command, shell=True)!= 0: fcntl.close(fd[0]) Here is the documentation for close() on However when calling it through subprocess.call, will it close the file that was opened via the fd[0]? A: Yes. It doesn't care how you call the function. If you read the documentation of the C function: int close(int fd); You can see that it only closes the file descriptor, but does not affect the file's state. Despite protests from the left wing of the party, Cameron is set to grant Ukip a MPs’ backbench debate on cutting benefits for EU migrants in a move which will help his party fight next year’s general election, the Daily Telegraph can reveal. The move follows a meeting of the cabinet last week, which will now allow the former coalition partners to have a showdown on 6d1f23a050
