Orchestra - Live in Concert at the Heineken music Hall - BDRip-AVC 720p. of de ses concerts [2003.,DVD5] BBC - Old Grey Whistle Test Rod Stewart.. BajarÂ .Q: What is the difference between basic mongodb operations and 'aggregate' operations? From the MongoDB's docs: In general, all of the operations in the MongoDB shell can be broken down into two categories, those that are "basic" and those that are "aggregate". The basic set is a small set of operations that allow queries and updates to be performed on small collections. The aggregate set is a large set of operations that allows complex queries and updates to be performed on large collections. So when we say "it is possible to combine multiple basic operations into one aggregate operation" what is the specific implementation of the "combination"? A: This does not preclude the use of the Aggregate framework as outlined in the docs In general, all of the operations in the MongoDB shell can be broken down into two categories, those that are "basic" and those that are "aggregate". The basic set is a small set of operations that allow queries and updates to be performed on small collections. The aggregate set is a large set of operations that allows complex queries and updates to be performed on large collections. You can combine basic operations into an aggregate, but not all aggregate operations are combined to make a more basic operation. For example: { $match: { "name": "Ada"} } { $sort: { "name": 1 } } { $group: { "name": "$name", "age": {$ c6a93da74d
