Q: Is there a class of weather types (ie. tropical storms, sub-tropical storms)? I recently learned about the classification of weather systems. However, I noticed that tropical storms are not always tropical storms. All the tropical storms I know of are tropical cyclones, for example, hurricanes. However, a tropical cyclone is not a tropical storm. Is there a sub-classification of weather types that fits in with the classification of weather systems? A: Yes there is: This includes tornadoes, of course, but also also baroclinic events, like the JMA classification of Vortices Why are Baroclinic vortices referred to as 'sub-tropical cyclones'? Baroclinic vortices are created when air that is colder than the surrounding air is forced to move to one side of a sub-tropical cyclone, over the colder air. This causes the air to rise, which is why there is often a low pressure area in the middle of a Baroclinic vortex. The resulting vortex is called a sub-tropical cyclone. Why are Baroclinic vortices called 'sub-tropical cyclones'? This convention stems from the observation of Baroclinic vortices on weather radar, where the radar signal was created by small raindrops in the air. The raindrops got swept around from the cold to the warm side, and resulted in a low-pressure area. Why is a Baroclinic vortex not called a 'tropical cyclone' (as cyclones are usually called)? This is simply because those are the names c6a93da74d
