The best thing about Lightroom 5 is that it now folds film simulation into its photo editing process. When you unlock the film simulator, you get a pretty interface where you can set the wavelength for the different film types. (Installing film simulation is easy.) You can also adjust the Contrast, Grain and Saturation as well as the sharpening, Gamma and Distortion settings. This may be even more useful for prospective or existing film users as well as for users who prefer to edit in RAW. In the past, some work was needed to create the initial “film look” in photos. I found it a bit difficult to get there from the “Normal” or “Correct” look. Editing settings typically get stored after a three-digit number (with the explanation of that number on the right side of the window). This can be changed if you want, but it’s not really necessary unless you’ve developed a strong dislike for the view. Lightroom 5 finally makes it possible to modify such numbers directly from the interface, without needing to look at the image and then the film settings window. One of the most useful new features in Lightroom 5 are the year-view and grid-view. The latter is a feature I already liked a lot in Lightroom 4.2, but now it’s even better. In Lightroom 5, every image in the catalog gets a grid view where you can easily see the most recent changes. One of Lightroom’s lesser-appreciated, but nonetheless useful, features is the unappealing way called “export reference.” It’s a way to export a particular version of a photo to the gallery. I use it frequently to make a backup copy of images in Lightroom, usually so I can restore a particular version in case something goes wrong. To do that, you first need to select the image on the left side of the interface. Then, you click the image header three times to activate an export reference. Then, you see the Export option on the right side of the window. More often than not, I go back to the original version of the photo. Lightroom 5 makes exporting references to the export menu (instead of the context menu) just like selectively importing references. If you’ve deleted the original version of the photo, you’ll see an About Recovery option there as well. One thing to note is that a photo cannot be exported and imported at the same time. You can make a backup of a selected photo, but you cannot go back to that same photo later unless you set a unique name for it. This means you wouldn’t be able to easily “undo” a mistake if you needed that photo again. That’s the price you pay for features that let you reference a particular version of a photo.
